

EO RIS BY XIMEO

Advanced radiological management

Product description:

eo RIS offers radiology practices the following features:

Agenda

The electronic diary developed for eoRIS allows you to plan all your exams according to the type of exam, the availability of your rooms and your staff resources.

Report and results

eoRIS offers the radiologist the possibility to easily write his reports. Integrated speech recognition allows the user to dictate their protocols. Once validated, protocols can be printed and sent in hard copy or electronic version.

Billing and insurability

eoRIS integrates an invoicing module allowing direct invoicing of radiological services performed as well as pharmaceutical products used during of the exam. eoRIS also checks patient insurability and is compatible with the third-party payment mechanism. The system respects all INAMI constraints. In the event of a conflict, it alerts the user to an inconsistency in the codes chosen. The nomenclature and codes are updated automatically when changes are made by the INAMI.

Inter-system communication

eoRIS is developed to work in an integrated way with eoPACS. You can view the patient record directly from eoPACS and start writing the report with a single click while looking at the pictures.

Communications with other systems (patient record) can be done via HL7, XML, etc. exchanges.
