

EO PACS BY XIMEO

The PACS solution adapted to your needs

Product description:

eoPACS is an application for the storage, delivery and advanced interpretation of DICOM images generated by various medical imaging modalities (scanner, MRI, conventional radiology, ultrasound, bone densitometry, mammography).

eoPACS is the ideal partner in the day-to-day work of the radiologist. A toolbox is available for reconstructions (MPR, MIP, 3D) and measurements of area, distance, angle or density. The advanced management of display profiles (pending protocol) greatly facilitates the work of the radiologist.

eoPACS effectively monitors your patients and makes it possible to compare old images with new exams.

eoPACS centralizes communication between the different systems and ensures the storage of images over time in a very secure way.

A backup system on site or outsourced can also be set up.

The application is EEC 93/42 certified.

Remote connection:

The application can also work via a secure internet connection. The user can thus remotely access all the data of the radiology center while using the tools provided by the application.

Characteristics

- PACS system
